PROFESSIONAL SUMMARY

Software Development Engineer in Test (SDET) with 4+ years of experience building and maintaining scalable automation frameworks for UI and API testing, now expanding into DevOps and platform engineering. Hands-on with containerization (Docker), Kubernetes orchestration, and CI/CD automation (Jenkins, ArgoCD, JFrog Artifactory), alongside REST API automation with Postman and Linux-based systems. At Newfold Digital, built ephemeral preview pipelines and GitOps delivery for multiple Bluehost services, and added production deployment reporting. Experienced in testing large-scale distributed platforms and driving higher quality and faster, reliable releases through automation, GitOps workflows, and Agile QA practices.

CORE SKILLS

Programming & Automation: Java (Proficient), Python (Working Knowledge), C# (Working Knowledge), SQL, Selenium WebDriver, Cucumber (BDD), Postman, Object-Oriented Programming (OOP), Data Structures & Algorithms, Problem Solving

Test Frameworks: Page Object Model (POM), TestNG, BDD Cucumber, Robot Framework

DevOps & Containerization: Docker, Kubernetes (Oracle OKE / OCI), Helm, ArgoCD (GitOps, Image Updater), Jenkins (Kubernetes agents, Groovy pipelines, Bitbucket Cloud webhooks), GitLab CI/CD, JFrog Artifactory, Git, GitHub, Bitbucket, SonarQube, Trivy, Jellyfish (DORA), Environment Provisioning

API & Testing: REST APIs, Postman, Functional, Regression & Automated Testing

Tools & Processes: JIRA, Xray, Agile Scrum, SDLC, STLC, Maven, Kibana, Backstage

Systems & Networking: Linux/Unix environments and networking concepts (TCP/IP, HTTP, HTTPS, DNS)

PROFESSIONAL EXPERIENCE

Software Development Engineer in Test – Newfold Digital **Nov 2024 – Present**

- Automated and tested the Destiny hosting control panel, a modern replacement for cPanel, ensuring reliability across core hosting workflows.
- Designed and executed 250+ UI automated test cases using Python + Robot Framework, delivering strong regression coverage and stable releases.
- Built and optimized Jenkins CI pipelines, reducing test execution time by 40% and improving team productivity by 25%.
- Automated 150+ RESTful API test cases using Postman, increasing API test coverage by 60% and integrating validations into CI/CD workflows.
- Collaborated closely with developers and product owners by reviewing merge requests, managing defects in JIRA, and resolving 100+ issues in an Agile Scrum environment.
- Containerized applications with Docker and deployed them to Kubernetes (Oracle OKE / OCI) with Helm, including development and UAT setup and migration of application databases to managed OCI Postgres.
- Built ephemeral preview CI for Hosting MFE, Customer Portal, CTB MFE, Global CTB BFF, HUAPI, and UPP: Jenkins multibranch pipelines on Kubernetes, Bitbucket Cloud webhooks, Docker builds, unit tests, coverage gates, SonarQube, and Trivy scans before publish to JFrog Artifactory.
- Connected those pipelines to ArgoCD so a green build deploys a per-pull-request preview and posts the preview URL on the Bitbucket pull request. Stopped rebuilds when only the pull request description changed.
- Added Jellyfish DORA deployment reporting to production Jenkins pipelines for Hosting MFE, Customer Portal, CTB MFE, and HUAPI, with region, environment, and hotfix labels on main-branch deploys.
- Maintained ArgoCD applications, Image Updater tag rules, and Helm charts for UAT and production, including Site Audit Tool, the support bot, and Global CTB BFF previews on Oracle OKE.
- For Site Audit Tool, set the OCI Object Storage namespace and LLM configuration for UAT and production, mounted the Confluence API token from a Helm secret, and triggered Jenkins automatically after a pull request merged.
- For the support bot, moved Redis to a Recreate strategy for its ReadWriteOnce volume, tagged images for ArgoCD Image Updater, cleared pip-audit failures in CI, and pointed Jenkins at Bitbucket Cloud webhooks.
- For the AI sales agent, added a downstream UAT pipeline triggered by a Bitbucket webhook on merge, and ran unit tests on the source branch of the pull request.

- For the QE metrics dashboard, pinned UAT frontend and backend image tags in JFrog and ran backend unit tests inside a Docker-in-Docker Python container.
- Integrated a Backstage developer portal with a service catalog and Jenkins pipeline links so teams can find services and builds in one place.
- Migrated Jenkins pipelines from OKD to the dev Jenkins controller.
- Stood up Site Audit Tool beta and production on OCI OKE. Aligned Argo CD to Bitbucket master and Helm values.prod.yaml, restored missing database and integration configuration plus cluster secrets, and brought production to Synced and Healthy.
- Corrected Site Audit Tool production rollouts so Image Updater followed versioned prod tags instead of stale images, and cleared PVC multi-attach and scan-artifact storage so backend and worker pods could run.
- Restored Site Audit Tool production builds after merge by requiring Bitbucket pull-request fulfilled and repository push webhooks, then validating the Jenkins Generic Webhook Trigger end to end.
- Created beta and production for the Teams support bot. Jenkins publishes versioned beta images to Artifactory, Argo CD Image Updater tracks those tags, and the app syncs automatically on the pre-production cluster.
- Traced missing image-pull and integration secrets, and corrected cluster-scoped versus namespace-scoped secrets across pre-production and cloud-workspace clusters.

Test Engineer – Ivy Comptech **May 2023 – Nov 2024**

- Developed C# Selenium automation scripts using BDD frameworks to support end-to-end UI and API testing.
- Designed and executed 200+ automated test cases (UI & API), reducing overall testing time by 60% and improving team productivity by 20%.
- Automated GUI test scenarios using Selenium WebDriver (C#) to ensure application stability and regression reliability.
- Performed REST API testing using Postman, validating API functionality and integrating results into test cycles.
- Authored manual test cases in Xray, logged and tracked defects in JIRA, and collaborated within Agile Scrum and GitLab CI/CD environments.

Assistant System Analyst – C-Edge Technologies **Jun 2022 – May 2023**

- Developed Java-based Selenium automation scripts using Page Object Model (POM) to execute GUI test cases efficiently.
- Applied object-oriented programming (OOP) principles to design and maintain reusable and scalable automation code.
- Reviewed application requirements and created structured test cases covering account management, CIF creation, and financial transactions (RTGS, NEFT, POS).
- Executed functional testing across multiple modules, validating SB/CA/RD/FD/Loan accounts, customer services, and transaction workflows.
- Logged defects in JIRA, prepared detailed test execution reports, maintained test documentation, and actively participated in Agile Scrum ceremonies.

QA Engineer – IRIS Business Services Ltd. **Dec 2021 – May 2022**

- Wrote and executed test cases, logged defects, and prepared test documents.
- Performed functional, regression, and unit testing, and wrote automation scripts using Selenium WebDriver.
- Gained hands-on experience in manual and automation testing, with strong debugging and problem-solving skills.
- Maintained documentation of test results to assist in debugging and modification of software.
- Participated in Agile ceremonies including daily stand-ups, sprint planning, and retrospectives.

KEY PROJECTS

Destiny – Bluehost (cPanel Replacement Platform)

- Replacement of cPanel providing a unified control panel to manage domains, emails, databases, and applications.
- Automated UI and API test scenarios covering website management, DNS configuration, and email services.
- Tested backend features such as database management, bandwidth reports, and PHP configuration settings.
- Validated security features including SSH access, IP blocking, and SSL certificate installation.
- Automated one-click deployments for applications like WordPress and Joomla.
- Tested cron jobs, caching configurations, and performance tuning options to ensure platform stability.

Ephemeral Preview Platform – Bluehost

- On-demand previews for Hosting MFE, Customer Portal, CTB MFE, Global CTB BFF, HUAPI, and UPP, created only after CI passes.
- Jenkins on Kubernetes builds the Docker image, runs tests and SonarQube, scans it with Trivy, and publishes it to JFrog Artifactory.
- ArgoCD ApplicationSets deploy a short-lived preview from the pull request, and the pipeline writes the preview link back to Bitbucket.

Production GitOps and DORA Reporting – Bluehost

- Jellyfish deployment events from production Jenkins for Hosting MFE, Customer Portal, CTB MFE, and HUAPI, labeled by region, environment, and hotfix.
- ArgoCD Image Updater tracks versioned build tags for UAT and production instead of a floating latest tag.
- Helm and OCI configuration for Site Audit Tool, including the object storage namespace, LLM settings, and secret mounts for UAT and production.

Web Trading Client

- Sports trading platform supporting horse racing, greyhound racing, football, and multiple betting markets.
- Tested fixture creation, market setup, participant configuration, and odds updates.
- Validated betting limits, stake units, and stop-loss rules across different scenarios.
- Verified manual and automated payout flows based on event outcomes.
- Ensured real-time odds synchronization and market suspension/resumption handling.

Banking & Internet Banking Applications

- Enterprise banking platforms used by SBI employees and retail customers nationwide.
- Tested CIF creation, SB/CA/RD/FD/Loan accounts, and high-volume RTGS/NEFT transactions.
- Automated critical banking workflows using Selenium and TestNG frameworks.
- Validated secure login, account summaries, transaction history, and cheque-related services.
- Ensured data integrity, security, and production stability across banking operations.

EDUCATION

Bachelor of Engineering (Automobile) – Mumbai University

CERTIFICATIONS & ACHIEVEMENTS

- Operational Excellence Award for outstanding contributions in improving processes, quality, and efficiency at work.
- ISTQB Foundation Level
- Selenium Certification
- Java Programming Certification
- Solved 300+ LeetCode problems — leetcode.com/u/ikiran001
- 5-Star HackerRank (Java & DSA) — hackerrank.com/profile/kiran_jadhav1993
